Energy for Everyone is a European energy distribution company focused on renewable sources. We generate clean energy and we sell it to our customers in large European countries. For simplicity, our customers are clustered into four groups depending on their location: Italy, Spain and Greece are in the southern cluster while France, Germany and Norway are in the northern one.

We source most of our energy from wind farms in Sardinia (Italy), from our large solar fields in Spain and from two nuclear plants in central Europe. Our largest nuclear plant is located near Cologne in Germany and the other one is 3 km south of Bordeaux in France.

We offer two types of contracts to our users. Those who need a significant amount of energy usually buy "long" contracts, whereas smaller customers tend to choose our "short", pay as you go, option. The "long " contract option allows the customer to pay a fixed price regardless of the amount of energy utilised (below a limit of 100 kwh).
